

# Attic Armor® Attic Insulation

## Description

Attic Armor® is an advanced insulation designed using Fi-Foil's patented GFP (gas filled panel) technology. Attic Armor consists of seven layers. The five internal low-emittance aluminum layers form a honeycomb structure. The two exterior reflective aluminum barrier films provide additional thermal resistance. There are no fibers. The advanced design provides excellent performance by addressing all the modes of heat transfer: radiation, conduction and convection.

The product is packaged, shipped and stored flat which reduces freight costs adding to the Green characteristics. The product is expanded on the job site with air or inert gases based on the level of desired thermal performance.

Attic Armor is ideal for insulating existing attics but can also be used on suspended ceilings, walls, and floors.

**2011 Product of the Year Award!**

**Solution for Re-insulating Attics**

**Before**

**After**

## FEATURES & BENEFITS:

- Radiant Barrier & Insulation Combined
- Honeycomb Design
- High Performance
- Fiber-free
- Mold Resistant
- Lightweight
- Compact

**Made in the USA!**

**Attic Application**
